

PBEL PROJECT

SENTIMENT ANALYSIS OF PRODUCT REVIEWS USING NAIVE BAYES
ARTIFICIAL INTELLIGENCE 23 JUNE BATCH-1

INTERN'S NAME:- AVANISH DWIVEDI

TRAINER'S NAME:- MR. ANAND MAURYA

❏ **INTRODUCTION**

- Sentiment Analysis is a Natural Language Processing (NLP) technique used to determine the emotional tone behind text data.
- It is widely used in analyzing product reviews, social media posts, and customer feedback.
- This project focuses on classifying Amazon product reviews into three categories: Positive, Neutral, and Negative.
- The app is built using Python, trained with machine learning, and deployed using the Streamlit framework.

❑ **DATASET OVERVIEW**

- Dataset Source: Amazon Product Reviews Dataset (Reviews.csv)
- Total Records: ~500,000+ customer reviews
- Selected Columns:
 - Text (Review content)
 - Score (Rating from 1 to 5)
- Data Cleaning Steps:
 - Removed missing/null values
 - Filtered relevant columns only
 - Balanced the dataset by sampling equal reviews for each class (positive, neutral, negative).

❑ **PREPROCESSING**

- Converted all reviews to lowercase to maintain consistency
- Removed punctuation marks and special characters
- Removed stopwords (e.g., "is", "the", "and") using NLTK
- Applied word stemming using PorterStemmer (e.g., "playing" → "play")
- Cleaned text saved as new column for model training

MODEL BUILDING

- Text data converted into numerical features using TF-IDF Vectorizer
- Model Used: Multinomial Naive Bayes (best suited for text classification)
- Input Features: Cleaned review text
- Target Labels: Positive, Neutral, Negative
- Libraries Used:
 - Scikit-learn for model training
 - NLTK for text processing
 - Pandas for data handling
- Training performed on a balanced dataset to ensure fair learning

❑ WEB APP USING STREAMLIT

- Built an interactive web app using Streamlit (Python)
- User enters review → app predicts sentiment in real-time
- Displays:
 - Sentiment label + confidence score
 - Pie chart of predictions
 - Recent prediction history
- Extra Features:
 - Save & download history (CSV)
 - Clear history option
- Deployed on Streamlit Cloud

❏ OUTPUT SAMPLE :-

Amazon Review Sentiment Analyzer

Enter your review below and view your past predictions with charts.

 Write your review here:

this is good product.

Analyze

 Prediction: **POSITIVE** 

 Confidence: 36.61%

Amazon Review Sentiment Analyzer

Enter your review below and view your past predictions with charts.

 Write your review here:

this is bad product.

Analyze

 Prediction: **NEGATIVE**

 Confidence: 51.24%

Amazon Review Sentiment Analyzer

Enter your review below and view your past predictions with charts.

 Write your review here:

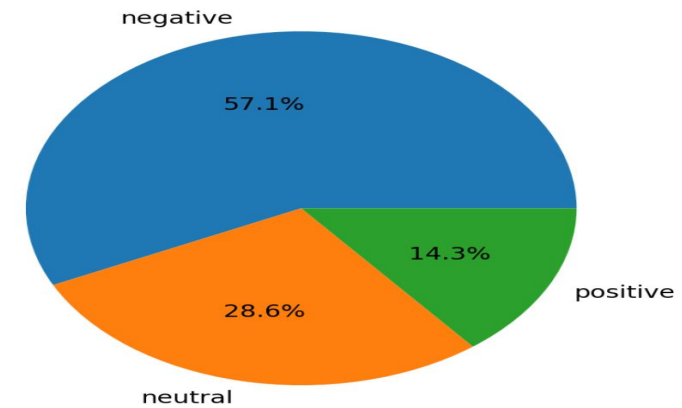

this product is neither good nor bad.

Analyze

 Prediction: **NEUTRAL**

 Confidence: 40.03%

Prediction Summary

❑ **CHALLENGES & SOLUTIONS**

- Overfitting Issue:
 - Problem: Model performed well on training data but poorly on new inputs
 - Solution: Used TF-IDF + class balancing to improve generalization
- Imbalanced Dataset:
 - Problem: More positive reviews than others
 - Solution: Sampled equal data for all 3 classes
- Deployment:
 - Problem: Making model accessible
 - Solution: Used Streamlit + GitHub + Streamlit Cloud
- Text Noise:
 - Problem: Slangs, stopwords, irrelevant words
 - Solution: Applied NLP cleaning and stemming

❑ **Conclusion**

- **Successfully built a sentiment analysis system for product reviews.**
- **Applied machine learning and NLP to classify reviews into Positive, Neutral, and Negative.**
- **Created an interactive and user-friendly web app using Streamlit .**
- **Visualized predictions and stored results with useful features.**
- **Deployed the app on Streamlit Cloud for public access.**
- **Future Scope:**
 - **Use of advanced models like BERT**
 - **Support for multiple languages**

***Thank
You!***
